

ABSTRACT

Information is transmitted and forwarded to a recipient. Data is entered into an input device and transmitted from the input device to a service unit. An electronic address of the recipient is searched for at the service unit based on a portion of the data. The data is transmitted from the service unit to the recipient when the electronic address is located. When the electronic address cannot be located, an indication is transmitted from the service unit to a control device that controls a printing device so that the control device can deliver the data to the printing device for non-electronic delivery.
